

	Reduction In MRSA Infections Well Controlled Studies (Interventions which use surveillance)	No Effect on MRSA Infections (Interventions which used surveillance, but had anomalies with Interventions)
	Robiseck A, et al. Ann Intern Med 2008. Mar. 18, 148(6): 409-18	Harbarth S. et al. JAMA. 2008, Mar. 12, 299(10):1149-57
	Rodríguez-Baño J, et al. Infect Control Hosp Epidemiol. 2010 Aug;31(8):786-95	Huskins WC, et al. NEJM. Apr. 2011; 364; 1407-1428.
	Lee AS, et al. BMJ Open. 2013; 3: e00312	
	Reduction In MRSA Infections Before and After Studies (Interventions which use surveillance)	Concluded Surveillance Not Better Than Chlorhexidine
	Jain R, et al., NEJM. Apr. 2011; 364: 1419-1430	Huang SS, et al. NEJM. June 2013; 368:2255-2265
S S	Almost 40 other studies.	

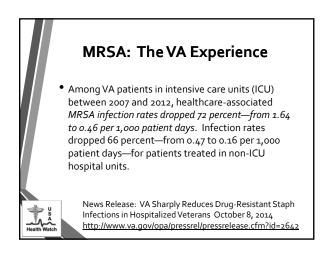

### • Well Controlled Study (surveillance, decolonization and contact isolation). • MRSA decreased by: -- 36.2% from baseline to ICU Surveillance. -- 69.6% from baseline to Universal Surveillance. Robiseck A, et al., Ann Intern Med 2008. Mar. 18, 148(6): 409-18

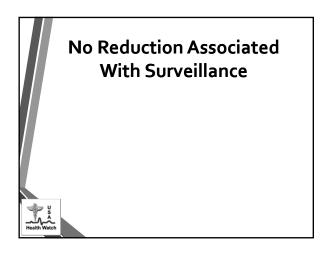

## • "In surgical wards with relatively low MRSA prevalence, a combination of enhanced standard and MRSA-specific infection control approaches was required to reduce MRSA rates. Implementation of single interventions was not effective, except in clean surgery wards where MRSA screening coupled with contact precautions and decolonisation was associated with significant reductions in MRSA clinical culture and infection rates."

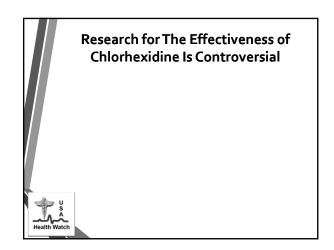

# MRSA: Rodriguez-Bano, et al. To the right is a drop in MRSA bacteremia observed by Rodriguez-Bano, et al. (Period C represents the time period when active MRSA surveillance, & decolonization in patients and healthcare workers were performed in units where there was MRSA transmission. A: No decrease in MSSA bacteremia, B: Decrease found in MRSA Bacteria. Rodríguez-Baño J, et al., Infect Control Hosp Epidemiol. 2010 Aug; 31(8):786-95

### MRSA: Harbarth, et al.

- Prior to surgery over half of the known MRSA carriers were not given antibiotics effective against MRSA and because of delays and emergency intervention, 31% of the carriers were identified as MRSA carriers only after surgery.
- Of the patients who developed a MRSA infection and were known carriers prior to surgery, only 43% received prophylaxis against MRSA and almost 60% did not receive optimal decolonization of MRSA prior to surgery.
- 10 MRSA Carriers, known prior to surgery, did not receive MRSA prophylaxis and developed an MRSA Infection.

Harbarth S. et al., JAMA. 2008, Mar. 12; 299(10):1149-57

U S A Health Watch

This study effectively was negated by Lee, et al. Harbarth, S. was the corresponding author of this study.

### MRSA: Huang, et al.

- Found a significant decrease in MRSA clinical cultures associated with daily bathing with chlorhexidine.
- "Changes in important metrics: According to <u>www.clinicaltrials.gov</u>, 6 months after the study completion date, the registry's records for the study were updated by adding a measure for all-pathogen bloodstream infections and eliminating the measures for central line- associated bloodstream infections and MRSA urinary cultures."
- "The all-pathogen bloodstream infection (primarily skin commensal organisms) and nosocomial MRSA clinical culture measures showed a statistically significant improvement over the control. MRSA bacteremia reduction was not significant."

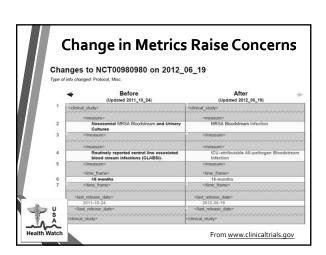

Huang SS, Septimus E, Kleinman K, Moody J, Hickok J, Avery TR, Landewicz J, Gombosev A, Terptata L, Hartford F, Hugden MK, Jemiga A, Weinsten RA, Pisare VJ, Jufferneffeck, Cui E, Kojanov, Ec, Lolant S, Pelini B, Paltit P, the CDC Prevention Epicentes Program, the AHRO DECIDE Network and Healthcare-Associated Infections Program. Targeted versus Universal Decolonization to Prevent ICU Infection. N Engl J Med. 2013 May 29, [Epub ahead of print] PMID: 237832-2.

### MRSA: Huskins, et al.

- "... when contact precautions were specified, gloves were used for a median of 82% of contacts, gowns for 77% of contacts, and hand hygiene after 69% of contacts."
- Results of admission MRSA cultures took 5 days to get back.

### MRSA: Derde, et al.

 Derde et al. (Lancet, 2014), also observed a significant decrease in MRSA acquisitions with improved hand hygiene and unit-wide daily chlorhexidine body washes protocols.

There was not a significant decrease in vancomycinresistant Enterococcus or Enterobacteriaceae acquisitions .

 There is also concern regarding the promotion of bacterial resistance. Disturbingly, Derde et al. reported a 13 to 14% incidence of MRSA resistance to chlorhexidine.

### **Effectiveness of CHX**

 Maiwald and Chan could find "no evidence that chlorhexidine without alcohol was effective" and that many trials compared chlorhexidine plus alcohol (two antiseptics) to povidone-iodine alone (one antiseptic) with some trials then attributing the clinical efficiency to chlorhexidine alone.

- Climo, et al. compared reduction in primary bloodstream infections with daily bathing using 2% chlorhexidine gluconate washcloths to daily bathing with nonantimicrobial washcloths.
- They did not observe a decrease in MRSA or VRE bloodstream infections in the chlorhexidine group compared to the nonantimicrobial washcloth group.
- They did observe a decrease in CLABSIs and multiresistant drug organism acquisitions, although the decrease for MRSA acquisitions did not reach statistical significance (p=0.29). The largest decrease in bloodstream infections was for coagulase-negative staphylococci.

Climo MW, Yokoe DS, Warren DK, et al. Effect of daily chlorhexidine bathing on hospital-acquired infection. *N Engl J Med.* 2013; **368**(6):533-42. doi: 10.1056/NEJM0a1113849.

### **Chlorhexidine Resistance**

 The recent observation that MRSA strains carrying the antiseptic resistance genes qacA/B can be clinically resistant to chlorhexidine raises a note of caution against its unfettered use. The dissemination of chlorhexidineresistant MRSA would have implications for the decolonization of individual patients and for preventing transmission.

Edgeworth JD. Has decolonization played a central role in the decline in UK methicillin-resistant Staphylococcus aureus transmission? A focus on evidence from intensive care. J Antimicrob Chemother. 2011 Apr;66 Suppl 2:ii41-7. doi: 10.1093/jac/dkq325. Epub 2010 Sep 18.

### **Effectiveness of CHX**

 Rotter, et al. (1988) who found that preoperative bathing with chlorhexidine did not reduce surgical infections compared to bathing with a detergent.

Rotter ML, Larsen SO, Cooke EM, et al. A comparison of the effects of preoperative whole-body bathing with detergent alone and with detergent containing chlorhexidine gluconate on the frequency of wound infections after clean surgery. The European Working Party on Control of Hospital Infections. J Hosp Infect 1988, 12:310–320.

### Multiple Studies Are Finding Reduced Susceptibility to Chlorhexidine

Organisms causing CLABSIs were more likely to have reduced chlorhexidine susceptibility in patients bathed daily with chlorhexidine,

Suwantarat N, et al. High prevalence of reduced chlorhexidine susceptibility in organisms causing central line-associated bloodstream infections. Infect Control Hosp Epidemiol. 2014 Sep;35(9):1183-6.

MRSA chlorhexidine resistance is an independent factor predictive of decolonization failure.

Lee AS, et al. Impact of combined low-level mupirocin and genotypic chlorhexidine resistance on persistent methicillin-resistant Staphylococcus aureus carriage after decolonization therapy: a case-control study. Clin Infect Dis. 2011 Jun 15;52(12):1422-30.

### Research Indicates Daily Chlorhexidine Has a Risk of Worsening Bacterial Resistance

- Because Chlorhexidine is used externally it affects the entire microbiome of the facility.
- The extremely drug resistant strain of Klebsiella can develop reduced susceptibility to Chlorhexidine.

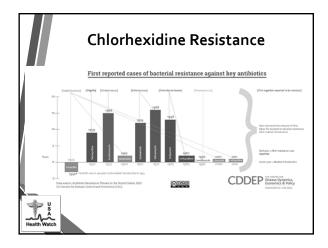

Naparstek L, et al. Reduced susceptibility to chlorhexidine among extremely-drug resistant strains of Klebsiella pneumoniae. J. Hosp. Infect. 2012. 81:15–19.

### Preop MRSA Surveillance

- Harbarth S. et al. JAMA. 2008, Mar. 12; 299(10):1149-57
   Found no effect but serious flaws.
- Lee AS, et al. BMJ Open. 2013; 3: e00312 Was a well controlled multi-national study which found a beneficial effect. Harbarth, S was the corresponding author of this study.
- Multiple other studies most of which did not control for secular trends (were before and after studies) also found a beneficial effect.

### **Preop MRSA Surveillance**

- MRSA Carriers Have a Higher Risk for Developing MRSA Infections.
- Screening determines the length of preoperative decolonization. (One vs. five days of chlorhexidine.
- Type of Antibiotic Used Pre-Op May Depend Upon Carrier State.

### **Allegations of Industrial Influence**

- Questions of Conflict-of-Interest and Industrial Influence first arose around a major study published in the NEJM (2010) regarding the effectiveness of a chlorhexidine-Alcohol antiseptic. (1,2)
- This study was part of a \$40 million Dept. of Justice Settlement with CareFusion and an alleged 11 million dollar kickback. (3)
  - 1. Brian J. Influential patient safety board cut ties with doc before CareFusion kickbacks case. Mass Device. Jan. 22, 2014. 2. Allen M. Hidden Financial Ties Rattle Top Health Quality Group. Propublica. Jan. 28, 2014
  - 3. Department of Justice. CareFusion to Pay the Government \$40.1 Million to Resolve Allegations That Include More Than \$11 Million in Kickbacks to One Doctor. Jan. 9, 2014.

### **UK - National Health Service**

### The United Kingdom's National Health Service's best practices include MRSA screening of:

- Orthopaedics, cardiothoracic and neurosurgical patients;
- · Emergency orthopaedic and trauma admissions;
- Critical care admissions;
- All elective surgical patients;
- Previous MRSA carriers; oncology/chemotherapy patients;
- · Renal patients;
- Patients admitted from high risks settings such as nursing homes and care homes and;
- · All emergency admissions.

### **UK - National Health Service**

"... the logical conclusion of risk factor assessments and the results of modelling studies is that the most appropriate approach to the reduction in MRSA carriage in the population, and resultant MRSA infections, is the universal screening of all admissions to hospital."

Screening for Methicillin-resistant Staphylococcus aureus (MRSA) colonization. A strategy for NHS trusts: summary of best practices.
